

SINGLE SPECIES

TECH SHEET

JAPANESE MILLET

Japanese Millet is a warm-season annual grass commonly grown for forage. It grows up to 5' tall and has a slightly coarser stem than other hay millets. It is extremely quick growing and can be ready to cut for hay within 50 days of planting. It also displays good regrowth persistence in a multi-cut haying or grazing scenario. Japanese millet can be easily cured for hay and will have forage quality similar to other millet or small grain hay. It has much better tolerance to flooding than other summer annual forages and can grow in heavy, wet soils. Japanese Millet also has a higher level of saline tolerance than other millets.

AGRONOMICS

Planting Time	Late Spring-Mid Summer
Drilled Seeding Rate	20-25 lbs/acre
Seeding Depth	1/2-3/4 inch
Package	50 lb bag, 2,000 lb tote
